Lab 8: Key Board (Calculator and Caps Lock Control)

Objective

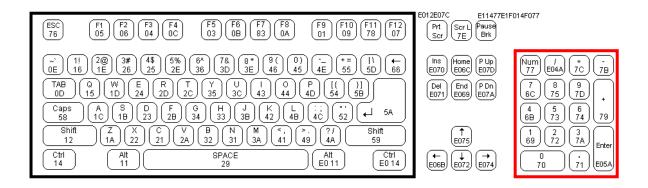

✓ Implement the keyboard function

Prerequisite

- ✓ Fundamentals of logic gates.
- ✓ Logic modeling in Verilog HDL.
- ✓ Keyboard control procedure

Experiments

- 1. Implement key board using the left-hand-side keyboard (inside the black blocks).
 - 1.1 Press 0/1/2/3/4/5/6/7/8/9 and show them in the seven-segment display. When a new number is pressed, the previous number is refreshed and overwritten.
 - 1.2 Press a/s/m (addition/subtraction/multiplication) and show them in the seven-segment display as your own defined A/S/M pattern. When you press "Enter", refresh (turn off) the seven-segment display.
- 2. Implement a single digit decimal adder using the left-hand-side keyboard (inside the black blocks). Use the key board as the input and display the results on the 7-segment display (The first two digit are the addend/augend, and the last two digits are the sum).
- 3. Implement a two-digit decimal adder/subtractor/multiplier using the right-hand-side keyboard (inside the red block). You don't need to show all inputs and outputs at the same time in the 7-segment display. You just need to show inputs when they are pressed and show the results after "Enter" is pressed.

- 4. Implement the "Caps" control in the keyboard. When you press A-Z and a-z in the keyboard, the ASCII code of the pressed key (letter) is shown on 7-bit LEDs.
 - 4.1 Press "Caps Lock" key to change the status of capital/lower case on the keyboard. Use a led to indicate the status of capital/lowercase in the keyboard and show the ASSCII code of the pressed key on 7-bit LEDs.
 - 4.2 Implement the combinational keys. When you press "Shift" and the letter keys at the same time, 7-bit LEDs will show the ASCII code of the uppercase/lowercase of the pressed letter when the "Caps Lock" is at the lowercase/uppercase status.
